FORMULATION AND EVALUATION OF MICROCAPSULES OF FURAZOLIDONE

Sonali Jat* Dr. Shikha Agrawal

Department of Pharmaceutics, Swami Vivekananda College of Pharmacy, Indore 452020, Madhya Pradesh, India

ABSTRACT
The objective of the present study was to develop Furazolidone prolonged release microcapsules by solvent evaporation method. This sustained release of microcapsules is additionally influenced by the formulation of latest biodegradable polymer HPMC and Ethyl cellulose, hence drug release pattern. The ready microcapsules were subjected to numerous pre and post formulation studies. Prepared microcapsules were evaluated for the particle size, percentage yield, entrapment efficiency, wall thickness, estimation of drug content and in vitro drug release studies. Results of the present study indicate that Furazolidone microcapsules can be successfully designed to develop sustained drug delivery, that reduces the dosing frequency and thereby we can increase the patient compliance.

Keywords: Furazolidone, Ethyl Cellulose, HPMC, Microcapsules, Solvent evaporation.

INTRODUCTION
Microencapsulation is a useful method which, prolongs the duration of drug effect significantly and improves patient compliance. Eventually the total dose and few adverse reactions may be reduced since a steady plasma concentration is maintained.¹

Furazolidone is used to treat bacterial and protozoal infections. It works by killing bacteria and protozoa (tiny, one-celled animals). Some protozoa are parasites that can cause many different kinds of infections in the body. Furazolidone is taken by mouth. It works inside the intestinal tract to treat cholera, colitis, and/or diarrhea caused by bacteria, and giardiasis. This medicine is sometimes given with other medicines for bacterial infections. Furazolidone may cause some serious side effects when taken with certain foods, beverages, or other medicines.¹⁰

Microencapsulation is defined as the application of a thin coating to individual core materials that have an arbitrary particle size range between 5 and 5000 um. Microencapsulation is widely used in the pharmaceutical and other sciences to mask tasted or odors, prolong release, impart stability to drug molecules, improve bioavailability, and as multi particulate dosage forms to produce controlled or targeted drug delivery. It is therefore, a rapidly expanding technology for achieving sustained-release dosage forms.²

The solvent evaporation method of microencapsulation involves the use of emulsification of a solution containing polymer and drug with an additional medium in which the drug and polymer
cannot dissolve. The technique is relatively simple and has been used to prepare microcapsules of a variety of compounds using several different polymeric materials.\(^3,4\)

Reason for the selection of furazolidone microcapsules are Extended duration of activity for short half life drugs, Decreased toxicity, and reduction of required dose, Optimized therapy and better patient compliance, Predictable and reproducible release rates, of maximizing the bioavailability of conventional drugs with minimum side effects.

The aim of this work was to develop microcapsules of Furazolidone by solvent evaporation technique. Due to prolonged release.

**MATERIALS**

Furazolidone was obtained as a gift sample from the Plethico Pharmaceutical Limited, India. Prolonged release polymer Ethyl cellulose, HPMC were supplied as gift sample by Central Drug House Ltd., Liquid paraffin, petroleum ether was obtained from Rankem Lab. Reagent, Span 80 were supplied from Loba Chemise Pvt. Ltd., Chloroform was supplied from Molychem. All other chemicals and reagent used in this study were of analytical grade.

**Preformulation Study:**

**Methods:**

**Physical appearance:** The supplied sample of Furazolidone was visualized.

**Identification of drug:**

- **Identification by UV spectrophotometer:** The identification of drug was done by UV spectrophotometer method. The 25 mg of drug was dissolved in 100 ml of distilled water and scanned in UV. The absorbance was taken at 367 nm. The highest peak of Furazolidone and spectra was recorded.\(^11\)

- **Melting point determination:** Melting point determination of furazolidone was done by using melting point apparatus. In this method the presealed capillary was filled by the small amount of drug. Then capillary and thermometer was placed in placed point apparatus. Then see capillary for melting the dug. The temperature were noted when the drug start to melt and the drug till complete melt.

- **Solubility determination:** The solubility determination of furazolidone was carried out in water, chloroform, liquid paraffin, petroleum ether, ethanol. The excess of drug was added gradually to 5 ml of each solvent contained in 10 ml of vials and vials were sealed with rubber closures and aluminum seals. The vials shaken for 12 hr and allowed to equilibrate for 24 hrs. undistributed. The solution containing excess of drug were centrifuged and filtered through whatmen grade filter papers. Aliquots of filtrate were suitably diluted and the dilutions were analyzed on UV- visible spectrophotometer.
Partition coefficient determination: Accurately weighed 20 mg of drug was added into a mixture of 10 ml of water and 10 ml of n-octanol, placed in a separating funnel. It was shaken for 15 min. and allows standing 24 hrs. The phases was separated and filtered through whatman grade filter paper, and the amount of drug in phases was measured in UV-visible spectrophotometer. The partition coefficient were calculated as the ration of the concentration of drug in oil phase and water phase.\textsuperscript{14,15}

Determination of $\lambda_{\text{max}}$: The stock solutions were suitably diluted with distilled water so as to contain 10 $\mu$g/ml of Furazolidone. The solution were scanned in the UV region between 200-400 nm and found that furazolidone exhibited $\lambda_{\text{max}}$ at 367 nm.\textsuperscript{12}

Preparation of calibration curve: The standard stock solution of Furazolidone was prepared by dissolving 25 mg of drug in 100 ml of distilled water to get a concentration of 250 $\mu$g/ml. From this stock solution 0.5, 1, 1.5, 2 2.5, 3, 3.5, 4, 4.5, 5 ml solution was taken and dilute up to 10 ml with distilled water to get the desired concentration range (5-50 $\mu$g/ml). The linearity was observed in the concentration range of 5 to 50 $\mu$g/ml for furazolidone. The absorbance were observed against distilled water as blank and the calibration curve was plotted between concentration (x-axis) and absorbance (y-axis).\textsuperscript{13}

Drug excipient compatibility study: A small amount of drug substance with excipient that is, physical mixture of the drug and excipients in ration (1:1) were prepared to have maximum in tractions between them was placed in vial and rubber stopper was placed on the sealed properly. A storage period of 2 weeks for 60\textdegree C and the sample was retained for 2 months at 40\textdegree C. After storage the sample were observed physically for liquefication, cracking, odour, or gas forming, dis coloration.

Particle size analysis: Determination of average particle size of the furazolidone was carried out by the optical microscopy method. A minute quantity of furazolidone were dispersed in liquid paraffin and then spread on clean glass slide and average sizes of furazolidone were determined.\textsuperscript{14}

Formulation of Microcapsules
Microcapsules were prepared by solvent evaporation method. Various formulations of microcapsules were prepared using gradually increase ethyl cellulose, HPMC concentration. In this method the polymer is dissolved in a definite volume of internal phase (Chloroform, Ethanol) and then the drug is also dissolved in the polymer solution. This drug polymer solution is then dispersed in an external medium (Liquid paraffin) consisting 1% span 80 in a 500 ml of beaker. The whole system was stirred at a 800-1000 rpm using mechanical stirrer equipment with three propellers for 3-4 hrs at 25-40\textdegree C to ensure the evaporation of the solvent. The smooth-walled, rigid and discrete microcapsules were formed. The microcapsules were collected by decantation and the product was washed with petroleum ether (40-60\textdegree C), four times and dried at room temperature for 3 hrs.\textsuperscript{5,6,7}

Evaluation of Furazolidone Microcapsules

- **Particle size analysis:** Determination of average particle size of the furazolidone microcapsules was carried out by the optical microscopy method. A minute quantity of microcapsules were dispersed in liquid paraffin and then spread on clean glass slide and average sizes of microcapsules were determined in each batch.\(^{14}\)

- **Percentage yield:** The total amount of microcapsules obtained was weighed and the percentage yield calculated taking into consideration the weight of the drug and polymer.
  \[ \% \text{ Yield} = \left( \frac{\text{Practical yield}}{\text{Theoretical yield}} \right) \times 100 \]

- **Estimation of drug content:** Furazolidone drug content in the microcapsules was calculated by UV spectrophotometric (Shimadzu 1700) method. A sample of microcapsules equivalent to 100 mg was dissolved in 25 ml ethanol and the volume was adjusted up to 100 ml using phosphate buffer of pH 6.8. The solution was filtered through Whatman No. 1 filter paper. Then the filtrate was assayed for drug content by measuring the absorbance at 365 nm after suitable dilution.

- **Entrapment efficiency:** Entrapment efficiency was calculated using the formula:
  \[ \% \text{ Entrapment efficiency} = \left( \frac{\text{Estimated } \% \text{ drug content in microcapsules}}{\text{Theoretical } \% \text{ drug content in microcapsules}} \right) \times 100 \]

- **Wall thickness:** Wall thickness of furazolidone microcapsules was determined by:
  \[ \text{Wall thickness} = \text{Particle size of Drug} - \text{Particle size of Microcapsule} \]

- **In vitro drug release:** Drug release was studied by using USP type II dissolution test apparatus in phosphate buffer of pH 6 (900ml). The paddle speed at 100 rpm and bath temperature at 37 ± 0.5\(^0\)C were maintained throughout the experiment. A sample of microcapsules equivalent to 100 mg of furazolidone was used in each test. Aliquot equal to 5 ml of dissolution medium was withdrawn at specific time interval and replaced with
fresh medium to maintain sink condition. Sample was filtered through Whatman No. 1 filter paper and after suitable dilution with medium, the absorbance was determined by UV spectrophotometer (Shimadzu 1700) at 365 nm.\textsuperscript{16,18,19}

RESULT AND DISCUSSION

- **Organoletic properties:**
  - Colour : Pale Yellow
  - Crystalinity : Crystalline
  - Taste : Metallic
  - Odour : Odourless

- **pH determination:** The pH value of furazolidone was found to be 6.0 which is nearly to standard. So it shows that the drug is acidic.

- **Melting Point:** The melting point of was 251\textdegree-256\textdegree C which is nearly to standard of Furazolidone. So it shows that the drug is pure.

- **Solubility properties:**

  \begin{table}[h]
  \centering
  \begin{tabular}{|c|c|}
  \hline
  Solvents (10ml) & Solubility properties of the drug (10mg) \\
  \hline
  Water & ++++ \\
  Chloroform & +++ \\
  Liquid Paraffin & ++++ \\
  Petroleum Ether & + \\
  Ethanol & +++ \\
  \hline
  \end{tabular}
  \caption{Solubility properties of Furazolidone}
  \end{table}

  + Insoluble  
  ++ Poorly soluble  
  +++ Slightly soluble  
  ++++ Freely soluble

  Its shows the Furazolidone is excellent soluble in aqueous organic solvent.

- **Partition coefficient:** The partition coefficient of Furazolidone was found to be 0.99. The result has been shown that the drug is hydrophilic.

- **Particle size determination:**
  The result of the microscopic evaluation of particle size of the furazolidone particles are given below in table-

</tbody>
</table>

Least count (L.C) = 1.3
Particle size of Furazolidone = \( \frac{\sum \text{d}}{\sum \text{n}} \)
= 470.96\( \frac{1}{100} \)
= 4.70

Particle size was found to be 4.70 \( \mu \text{m} \) show that drug particle are distributed in range of 1-6 \( \mu \text{m} \) and maximum number of particle are present in size range of 4-6\( \mu \text{m} \). This distribution pattern also indicates that the drug is amorphous in nature.

- **Absorption maximum (λ\( \text{max} \)):** The solution were scanned in the UV region between 200-400 nm and found that furazolidone exhibited λ\( \text{max} \) at 362 nm which is nearby to the standard value of furazolidone. This so the drug is pure.

- **Identification of drug:** The identification of drug was done by UV spectrophotometer method. The highest peak showed at 362 nm which is nearby to the standard value of furazolidone. This so the drug is pure.

(Fig. 1. Identification Curve of Furazolidone)
Calibration curve:

**Equation:**

\[
Y = 0.035x + 0.008
\]

\[
R^2 = 0.998
\]

**X**= Concentration in micro gram

For preparation of standard curve, solution of the drug sample were prepared in distilled water and there absorbance were measured at 362 nm the linearity range were found to be 5-50 µg/ml. The furazolidone obey Beer’s law in the range 5-50 µg/ml.

- **IR Spectra:**

![IR Spectra of Furazolidone](image)
IR Spectrum of drug sample has been interpreted and correlate with standard IR spectrum of furazolidone. There is no change in functional group of drug sample or same with standard shown in figure. It show that the drug sample is furazolidone.

- **Drug excipients compatibility study:**

- **Particle size:** The particle size of microcapsules varied somewhat among the formulation variation in the method of preparation of various formulations. Particle size was found to be satisfied when prepared by solvent evaporation method. Microcapsules prepared by solvent evaporation method showing lesser size than other methods. The mean particle size of the microcapsules significantly increases with increasing polymer concentration. It was observed that, on increasing the polymer amount the average particle size increased. The particle size of formulations in the range between 4.32 µm to 6.90 µm.

Result shows that formulation F5 having quick release in 12.5±0.69 second. It indicates that amongst the prolonged release polymer ethyl cellulose and HPMC show better released profile microcapsules.

In vitro drug release was found between 86 – 98 % within 30 min of the study. The formulation F5 and F6 containing ethyl cellulose and HPMC in equal proportion have shown highest drug release (98±0.88) within 30 min compared to other formulations.

(Fig. 7. In Vitro Drug Release of Formulations)
The microcapsules are packed in suitable packaging and stored under the following condition for a period as prescribed by ICH guidelines for accelerated studies. In order to determine the change in particle size, percentage yield, wall thickness, entrapment efficiency, in vitro drug release studies, estimation of drug content study of different formulation.

CONCLUSION

- Formulation of microcapsules of Furazolidone for the prolonged release of drug.
- Formulations F4 and F5 were found to be best among all other formulation.
- Biodegradable hydrophilic polymer Ethyl cellulose and HPMC is suitable for the preparation of microcapsules for the sustained release.
- Viscosity of polymer plays the major role in formulation of microcapsules of furazolidone.
- There is no interaction between the polymer and drug of microcapsules of furazolidone.
- Microcapsules of Furazolidone can be used as anti bacterial agents.
- Improved the patient compliance.

ACKNOWLEDGEMENTS

Author’s are thankful to Swami Vivekanand College of Pharmacy, Indore (India) authority for providing suitable research laboratory to carry out this project work and it also thanks to the Plethico Pharmaceutical Limited, India, for providing gift sample of Furazolidone and thanks to B. M. College of Pharmaceutical Research and Education.
